

Task 1 - Chatbot with Rule-Based Responses

About

This is a simple chatbot built for the CodeSoft internship Task 1.

It responds to user inputs based on predefined rules using if-else statements and keyword/pattern matching to identify what the user is asking and give an appropriate reply.

What it does

The chatbot can respond to:

- Greetings (hello, hi)
- "how are you"
- "your name"
- "my name is ..."
- time
- date
- thank you

- weather
- help (shows what it can answer)
- bye

If it doesn't understand the input, it gives a fallback message asking the user to type "help".

How it works

- User types a message in the input box
- The message is converted to lowercase
- The `getBotReply()` function checks the message using if-else statements with `.includes()` to match keywords/patterns
- Based on the matched keyword, the bot sends back a fixed response

How to run

Just open `Chatbot.html` in any web browser (Chrome, etc.) - no installation or server needed. Works on both computer and phone.

Files

- `Chatbot.html` - contains the full chatbot (HTML + CSS + JavaScript in one file)

Tech used

HTML, CSS, JavaScript
